Patent No. 5891724
GENERAL INFORMATION:
APPLICANT: Deeley, Roger G.
APPLICANT: Cole, Susan P.C.
TITLE OF INVENTION: METHODS FOR CONFERRING MULTIDRUG
TITLE OF INVENTION: RESISTANCE ON A CELL
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
ADDRESSEE: PARTEQ RESEARCH & DEVELOPMENT INNOVATION

anti-cancer drugs for New transporter gene useful for screening Claim 23; Page 138-140; 153pp; English The present sequence encodes a human MPR-related ABC transporter (MOAT) protein, designated MOAT-D. The protein comprises a multi-domain structure including a tandem repeat of nucleotide binding folds appended C-terminal to a hydrophobic domain, having Walker A and B ATP binding sites and several potential membrane spanning domains. The MOAT nucleic acids are useful for screening a test compound for inhibition of MOAT mediated transport, indicated by restoration of anticancer drug sensitivity, which in turn causes a reduction of transporter mediated cellular efflux of anticancer agents. MOAT DNA or RNA may be used as probes to detect the presence or expression of genes encoding MOAT proteins. Anti-MOAT antibodies are useful for detecting and quantitating proteins MOAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   D,
```

activity, e.g. cancers (e.g. adenocarcinoma, lymphona, prostate cancer or uterus cancer), immune response, graft-versus-host disease, acquired immunodeficiency syndrome (AIDS), asthma, Crohn's disease, hypertension, congenital heart defects, multiple sclerosis, inflammation or Albright hereditary osteodystrophy and many other diseases listed in the specification. The DNA encoding the protein is useful in gene therapy for treating the conditions. This is also useful in detection assays, chromosome mapping, tissue typing, diagnostic or prognostic assays, or

for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. I

The invention relates to an isolated polypeptide (NOVX) a mature form of NOVX, a NOVX variant (differing by no more than 15%), the nucleotide encoding NOVX (or its complement, fragment or variant). NOVX is NOVI-14, 15%, 15%, 16%, and 16%. The NOVX polypeptide, nucleic acid encoding it and antibody against it, are useful for treating or preventing (e.g. by gene therapy) a NOVX-associated disorder in humans, e.g. cardiomyopathy, atherosolerosis, a disorder related to cell signal processing and metabolic pathway modulation, diabetes or cancers. The NOVX polypeptide and nucleic acids are also useful for determining the presence of predisposition to the diseases. The NOVX nucleic acid and polypeptide are especially useful in therapeutic or prophylactic

with

disorder associated

polypeptides for treating or preventing a disorder associate 1, in humans, e.g. cardiomyopathy, atherosclerosis or cancers

The present cDNA sequence encodes a human multidrug resistance-associated protein 3 (MRP3). The MRP3 gene has been localised to chromosome 17. The MRP3 protein is a member of the ATP-binding cassette (ABC) transporter family of anorganic anion transporters. MRP3 is a 4 domain protein, with 2 ATP-binding domains, and 2 domains with transmembrane regions. The correction is a homologue of MRP1, which is involved in ATP-dependent transport of glutathione conjugates such as dimitrophenyl glutathione. These substrates are also transported by a novel canalicular multispecific organic anion transported by a novel canalicular dependent cMOAT transporter system mediates hepatobiliary excretion in the liver. CMOAT may be a liver-specific homologue of multidrug collis with cMOAT protein activity. CMOAT protein activity in cells calls with cMOAT protein activity. CMOAT protein activity in cells collisense constructs, especially derived from another multidrug callstance (AMDR)-related protein, e.g. MMP-1, to the nucleic acids and vectors can be used to decrease the level of cMOAT in a cell. The nucleic acids and vectors can be used as an be used especially in diagnosis of public-Johnson acids and proteins and protein, e.g. MMP-1, it or the nucleic acids and acids and proteins and protein, allesses involving man and protein protein acids and a proteins and proteins acids and proteins and proteins and proteins of manner and acids and acids and proteins and proteins acids and proteins and proteins acids and acids and acids a

```
The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    part of the printed directly from WIPO

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set

## Claim 1; SEQ ID 3831; 44pp; English.

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, cesophageal, ovarian, kidney, prostate or pancreatic cancer.

Cadenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises) is indicative of anti-neoplastic activity. (I) has cytostatic expression is indicative of anti-neoplastic activity, and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, escophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lung, incompared to the concer, infiltrating ductal cancer, and infiltrating lung, according a colon, pression of the concertion and colon and c

```
The present sequence encodes a multi-drug resistance protein (MRP), isolated from H69AR, a small cell lung cancer cell line, which is about 50-did resistant to doxorubicin as compared to the parental H69 cell line. The human MRP gene has been mapped to 16p13.1, and is not linked to either CFTR or MDR genes. The MRP protein is overapressed in multi drug resistant cellsindependently of overexpression of P-glycoprotein camember of a superfamily of membrane proteins, across cell membranes, and associated with a variety of tumours). Antisense nucleic acids can be used to protect a drug sensitive cell from cytotoxicity due to exposure to a drug, or to develop improved forms of therapy, particularly for small cell lung cancers which exhibit a high initial response to chemotherapy which is almost always followed by a

                                            The human and murine MRP nucleic acid molecules can be used as probes fidentlfying multidary resistant tumour cells by hybridisation to mRNA from tumour cells. The antisense nucleic acid can be used to reverse multidary resistance (MDR). A recombinant expression vector containing the MRP nucleic acid molecules operatively linked to at least one regulatory sequence can be used to transform a host cell to produce a recombinant MDR-associated protein.
                                                                                                                                                                                                                                                                                               338

                                                                                                                                                                                                          The present sequence encodes a human multidrug resistance-associated protein (MRP). The present invention also describes a method for protecting a mammalian cell against the cytocoxicity of anthracyclines, epipodophyllotoxins and vince alkaloids (A) by introducing into it a nucleic acid (I) that hybridizes under stringent conditions to a nucleic acid (II) that encodes an MRP protein (III). Introduction of (I) protects cells against cytotoxic effects of (A), particularly to protect normal cells against (A) being used for treatment of cancers. Cells transformed with (I) can be used to screen for agents that affect unlitiding resistance or are directly toxic to multidrug resistant cells, i.e. potential therapeutics for multidrug-resistant cancers. Conferring resistance to normal cells safely.

```

This sequence encodes the human multidrug resistance-associated (MDR)
protein. The invention relates to a method for identifying a multidrug
resistant (WDR) tumour cell. Compositions and methods utilising the MDR
proteins can be used to treat patients with tumours displaying multidrug
resistance, particularly those displaying resistance to anthracyclines,
epipodophyllotoxins, vinca alkaloids, and hydrophobic drugs. The methods
for inhibiting/killing a MDR tumour cell can be useful for treating
breast cancer, leukaemias, fibrosarcomas, cervical cancer, gliomas,
thyomas, neuroblastomas and lung cancer. The MDR DNA sequences when
labeled are useful as molecular probes for diagnosing multidrug
resistance of a tumour (using cells from a tumour biopsy) and for
designing ribozymes which are capable of cleaving a single-stranded
nucleic acid encoding a protein having MRP activity. Recombinant
expression vectors containing human MDR coding sequences can be
transfected into a drug sensitive cell line to produce a protein in the
cell which confers MDR, protecting non-resistant non-tumour cells from
the effects of chemotherapeutics has major clinical importance. Cells
transformed with the MDR coding sequences are useful for testing
potential therapeutic agents for their effectiveness against MDR cells
and for identifying chemosensitisers of a therapeutic agent. with an antibody/antigen-binding fragment - which binds to an expressed protein encoded by multidrug resistance-associated protein (MRP) nucleic acid Claim 1; Column 51-62; 80pp; English. The present invention describes an antibody or antigen-binding fragment, which binds to a multidrug resistance-associated protein (MMP). The antibody or antigen-binding fragment does not bind only to a nucleotide antibody or antigen-binding fragment does not bind only to a nucleotide binding fold of the protein corresponding to the amino acid residues of 61-810 or the amino acid residues 1310-1469 of the amino acid sequence of given in AAB03582. The MMP is encoded by a fully defined 5011 bp sequence (the present sequence) or its allelic variant. The protein confers multidrug resistance to a drug-sensitive mammalian cell in which confers multidrug resistance is not substantially reversed by chemosensitisers, which reverse P-19roprotein-mediated multidrug resistance. The antibodies and bispecific and terameric antibody resistance. The antibodies and bispecific and treating multidrug resistant tumours, for inhibiting multidrug resistance of a cell by blocking the activity of an MMP, and for killing a multidrug resistance conferes and quantify the amount of MMP in a sample in order to diagnose multidrug resistance and determined the role of MMP in a particular cellular or pathological state. The new antibodies may be used in treating cancers and tumours, however the antibodies may be used in treating cancers and tumours, however the antibodies may be used in treating cancers and tumours, however the antibodies may be used in treating calculate to

The CDNA was identified using a differential display method in which monocytes from peripheral blood were subjected to macrophage differentiation and cholesterol loading with high density lipoproteins and subsequent c deloading with high density lipoproteins and subsequent choissterol sensitive genes. The gene maps to chromosome 16q13.12 and is also termed MRPI (multidrug resistance associated protein). The invention provides cholesterol-sensitive ABC genes (see AAC94734-63). These genes, and polypeptides encoded by them, can be used for diagnostic and therapeutic applications, and for blochemical or cell-based assays to screen for pharmacologically active modulator compounds useful for the treatment of lipid disorders, atherosclerosis or other inflammatory diseases such as

This sequence represents a human multidrug resistance protein (MRP) nucleocide sequence. The human MRP encoded by this sequence confers multidrug resistance, including resistance to at least two drugs selected from anthracyclines, epipodophyllotoxins and vinca alkaloids, on a drug sensitive mammalian cell, when the protein is expressed in the cell. The multidrug resistance is not substantially reversed by chemosensitizers which reverse P-glycoprotein-mediated multidrug resistance. The MRP protein sequence can be used to generate antibodies against MRP. The MRP protein and nucleotide sequences can be used in compositions which are used to treat patients with tumours displaying multidrug resistance. The compositions and methods of the invention can be used particularly to treat breast cancer, leukaemias, fibrosarcomas, cervical cancer, gliomas, MRP can be used to inhibit the multidrug resistance of a multidrug

a therapeutic agent in vitro. The method is useful for identifying chemosensitizers which may then be used to treat cancer (especially lung cancer). The method allows the identification of chemosensitizers which do not reverse P-glycoprotein-mediated multidrug resistance. The present sequence represents a cDNA encoding a human MRP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      278

Database																																

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
